A two-stroke petrol engine (used in scooters, motor cycles etc.). The cylinder L is connected to a closed crank chamber C.C. During the upward stroke of the piston M, the gases in L are compressed and at the same time fresh air and fuel (petrol) mixture enters the crank chamber through the valve V.

~~10 Reasons Why A 2 Stroke Engine May Lose Power / Help ...~~

A two-stroke engine is a type of internal combustion engine that completes a power cycle with two strokes of the piston during only one crankshaft revolution. This is in contrast to a "four-stroke engine", which requires four strokes of the piston to complete a power cycle during two crankshaft revolutions. In a two-stroke engine, the end of the combustion stroke and the beginning of the compression stroke happen simultaneously, with the intake and exhaust functions occurring at the same time. T

petrol engine differs from a 4 stroke petrol engine by the way it generates power in the number of revolutions of the crankshaft.

Unlike in a 4 stroke petrol engine, the 2 stroke spark ignition cycle produces power in each of its revolutions. The 2 stroke spark ignition gives way to the traditional four strokes to run its complete cycle. Instead, it merges two strokes into one; thereby making one upward stroke and one downward stroke in every ...
