Eventually, you will unquestionably discover a extra experience and realization by spending more cash. still when? attain you say yes that you require to get those every needs in imitation of having significantly cash? Why don't you try to get something basic in the beginning? That's something that will guide you to comprehend even more in relation to the globe, experience, some places, like history, amusement, and a lot more?

It is your very own era to statute reviewing habit. accompanied by guides you could enjoy now is ti ipc user guide below.

Inter-Processor Communication (IPC) provides a processor-agnostic API which can be used for communication between processors in a multi-processor environment (inter-core), communication to other threads on same processor (inter-process), and communication to peripherals (inter-device). The API supports message passing, streams, and linked lists.

~~IPC Users Guide - Texas Instruments Wiki~~

IPC is a component containing packages that are designed to allow communication between processors in a multi-processor environment and communication to peripherals. This communication includes message passing, streams, and linked lists. These work transparently in both uni-processor and multi-processor configurations.

~~SYS/BIOS Inter-Processor Communication (IPC) 1.25 (Rev. E)~~

The IPC product contains an examples/archive directory with device-specific examples. Once identifying your device, the examples can be unzipped anywhere on your build host. Typically once unzipped, the user edits the example's individual products.mak file and simply invokes make.

The ti.sdo.ipc.Notify module manages the multiplexing/demultiplexing of software interrupts over hardware interrupts. In order to use any Notify APIs, you must first call Ipc_start(). This sets up all the necessary Notify drivers, shared memory, and interprocessor interrupts.

~~IPC Users Guide/Notify Module - Texas Instruments Wiki~~

IPC provides an implementation of the IMessageQTransport interface called ti.sdo.ipc.transports.TransportShm (shared memory). You can write other implementations to meet your needs. When a transport is created via a transport-specific create() call, a remote processor ID (defined via the MultiProc module) is specified.

IPC Overview. The IPC product provides software connectivity between multiple processors. Each processor may run either an HLOS (e.g. Linux, QNX) or an RTOS (e.g. SYS/BIOS). IPC is an open source project, currently managed with git, and maintained at <http://git.ti.com/ipc/ipcdev> . Full source browsing, including all changes, are available here .
